

Impling Desktop Pet

By James Stuart

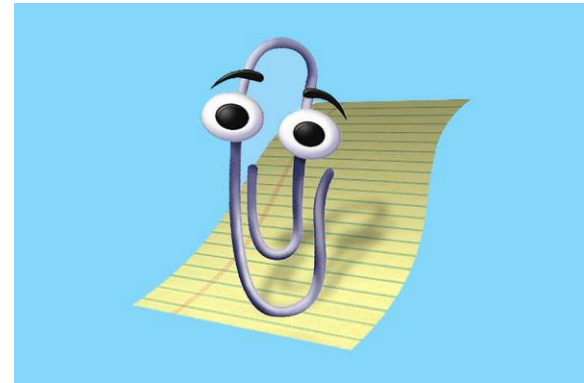

What is the problem I am solving?

Do you ever feel like there's something missing from your desktop? Doesn't it feel a bit lonely? Do you miss Clippy?

Boy oh boy do I have the solution for you.

Introducing your own desktop impling. Great for things like... Stress relief!!

Click him as much as you like he's like a stress ball. But watch out... He bites back.

Why solve it?

For the love of the game of course!

This desktop pet was made to be my own little virtual companion.

It can also simulate what drops you might get if you caught a dragon impling in the game OSRS.

What is my project?

It is a desktop pet. Simple as that. It has lots of features like:

- A bouncing Impling
- A balloon that can be popped for loot
- An enrage mode for the impling that chases your mouse
- Sound effects and images
- A menu with an inventory that is sortable

What is my project supposed to do?

All my project is supposed to do is make a charming little desktop pet with mischievous intentions.

What is my project currently doing (correctly/almost correctly)?

My project completed almost everything I set out to do. It flaps around the screen aimlessly just like the game flappy bird. It has a random event where a balloon flies through the sky and can be popped for some lore accurate drops.

What is my project currently not doing?

Currently my project does not have a fishing minigame.

It does not have the sprites that I designed for it. (I accidentally deleted them in a downloads folder purge)

And it does not dance when I play music on my computer.

What is my plan to fix these issues??

- For the fishing minigame I'd like to have an option in my menu where you click on it and it takes you to a small pond.
- For the sprite I was using the software Aseprite to generate an awesome pixel art version of my impling. It will be as simple as changes the path of the png to be loaded.
- And for the dancing when playing music I would have to have a class that detects when music is playing and then change the sprite to a gif of the impling dancing, which by the way, again, I designed and then accidentally deleted.

Why should you continue to fund me?

This project doesn't need a lot more to be a fully developed product.

I plan on implementing google ads into the desktop pet. When watched you will receive special in game currency that you can use to buy cool little outfits for your pet, like sunglasses.

The currency will also be used to purchase different kinds of desktop pets. Like maybe a cute lizard instead of an impling.

END
